

Choose Desktop for your application

You will only make two decisions here...

* User Interface Desktop

Schema US_B164_PLSQL_S09

* Name ACME Bookstore

* Application 12467

Theme Universal Theme (42)

Theme Style Vita

Don't Change This

Don't Change This

Give your application's name the name of your database such as Dog Walker, Wine Collector, Bicycle Repair and so on.

Do NOT change the Schema or the value in the Application textbox.

Your other decision is the Theme. Select the option button

Theme Universal Theme (42)

When the Select Theme window opens, click on the combo box button and select All Themes.

Select Theme

Show: Standard Themes

All Themes

Application Standard Themes

The choice is yours to make. The Universal Theme is the default and looks good and is the easiest to work with in many ways. The Tabs themes on the other hand offer the option of customizing more and giving you the opportunity to up your game.

Once you have selected your Theme you can go ahead and click on the Create Application button; no need to keep going Next.

This →

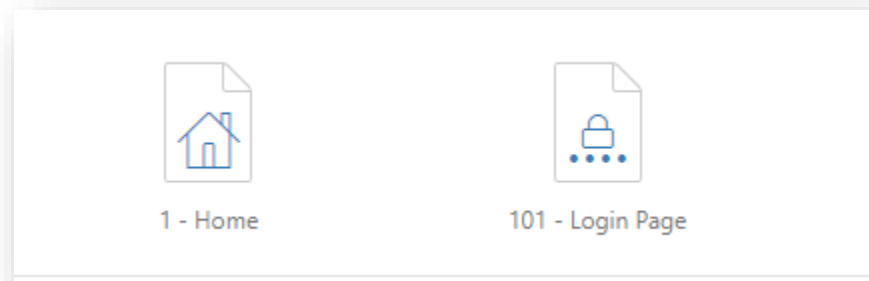

Create Application

Next >

Then this →

Create Application

You will then be taken to your Application. You will see two pages: Home, and Login Page.

We'll start with the Login Page. Click on the Login Page and it will open in the Page Designer window.

In the upper right of the Page Designer you will see the run button.

Click on the Run button and in a few moments your Login Page should open. The first thing you are going to need to do is to copy the URL. It will look something like this:

<https://iacademy3.oracle.com/ords3/f?p=12467:101:283513538719::::>

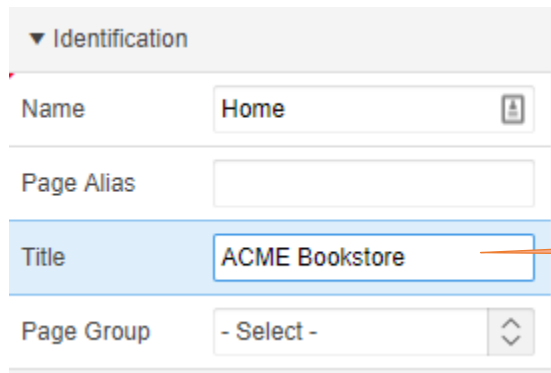

This is the URL you will need to include in your final project PDF file you will be turning in electronically.

The Username and Password is the same as your login into APEX. Test this to be certain it works. You will also be including the Username and Password in your final project PDF file. This is so your other professors can review your work in APEX. If you fail to insure the logins work and/or fail to provide this information in your final document, I will not issue a passing grade for your project.

Moving onto the Home page... I am going to try and keep this simple and down to the minimum requirements for the project. Remember, if you want a higher grade, you need to do more than the minimum.

Go back to the Application start page and click on the 1 – Home link to open the Home page in the Page Designer.

In the Page properties change the Title to the name of your database.

▼ Identification

Name Home

Page Alias

Title ACME Bookstore

Page Group - Select -

Change the title

In the Grid Layout, in the bottom section click on the Regions button.

HELP

REGION CONTENT

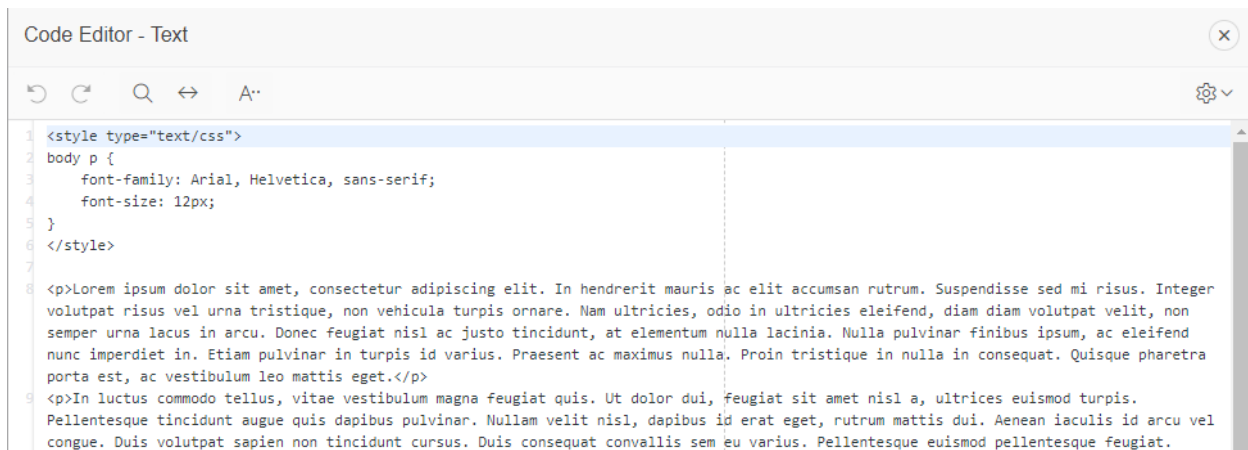

ITEMS

SUB REGIONS

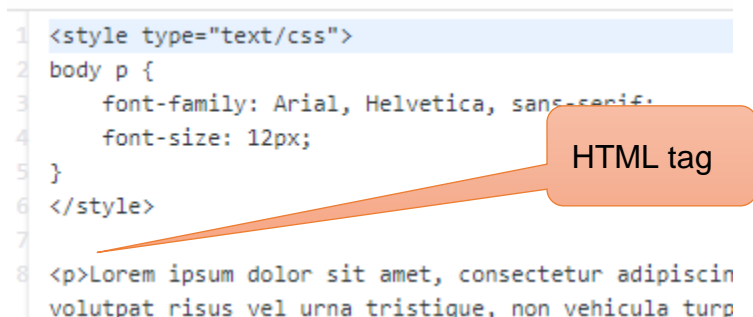

Click on the first “New” Static Content area and in the properties, in the Identification section under the Region tab, change the title to the name of your database followed by Summary as in: Dog Walker Summary, Wine Collector Summary and so on.

Still in the properties, in the Source section in Text, open the Code Editor – Text and copy in your well written summary of the database. Refer to Milestone 3 for more information.

In the example above you may note my use of CSS style tags. I strongly recommend you use styles in your application. You should also use HTML to format your text. Notice the <p> tag in the example below.

In the second Static Content area you added to the BODY, again go into the properties and change the Title to **Team Members** and in the Text area and using the Code Editor – Text, list your team members.

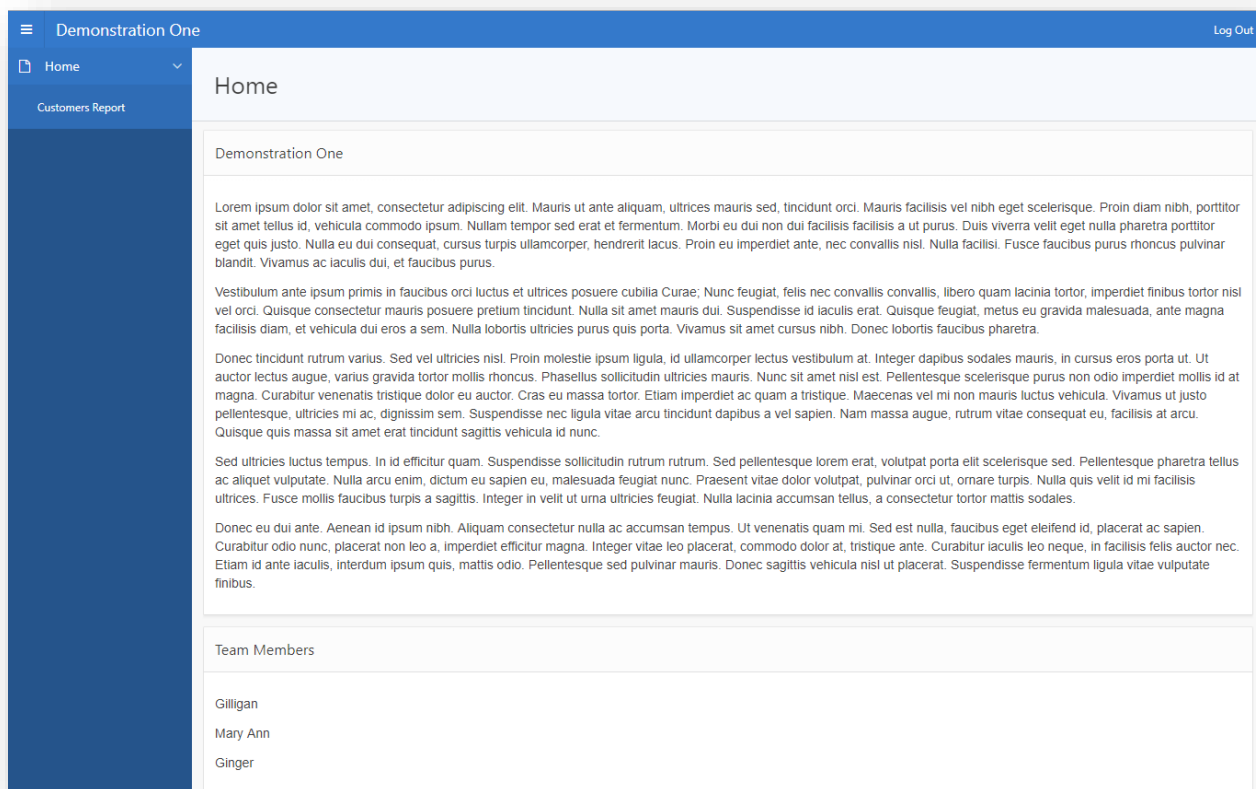

Code Editor - Text

```

1 <p>Gilligan</p>
2 <p>Mary Ann</p>
3 <p>Ginger</p>

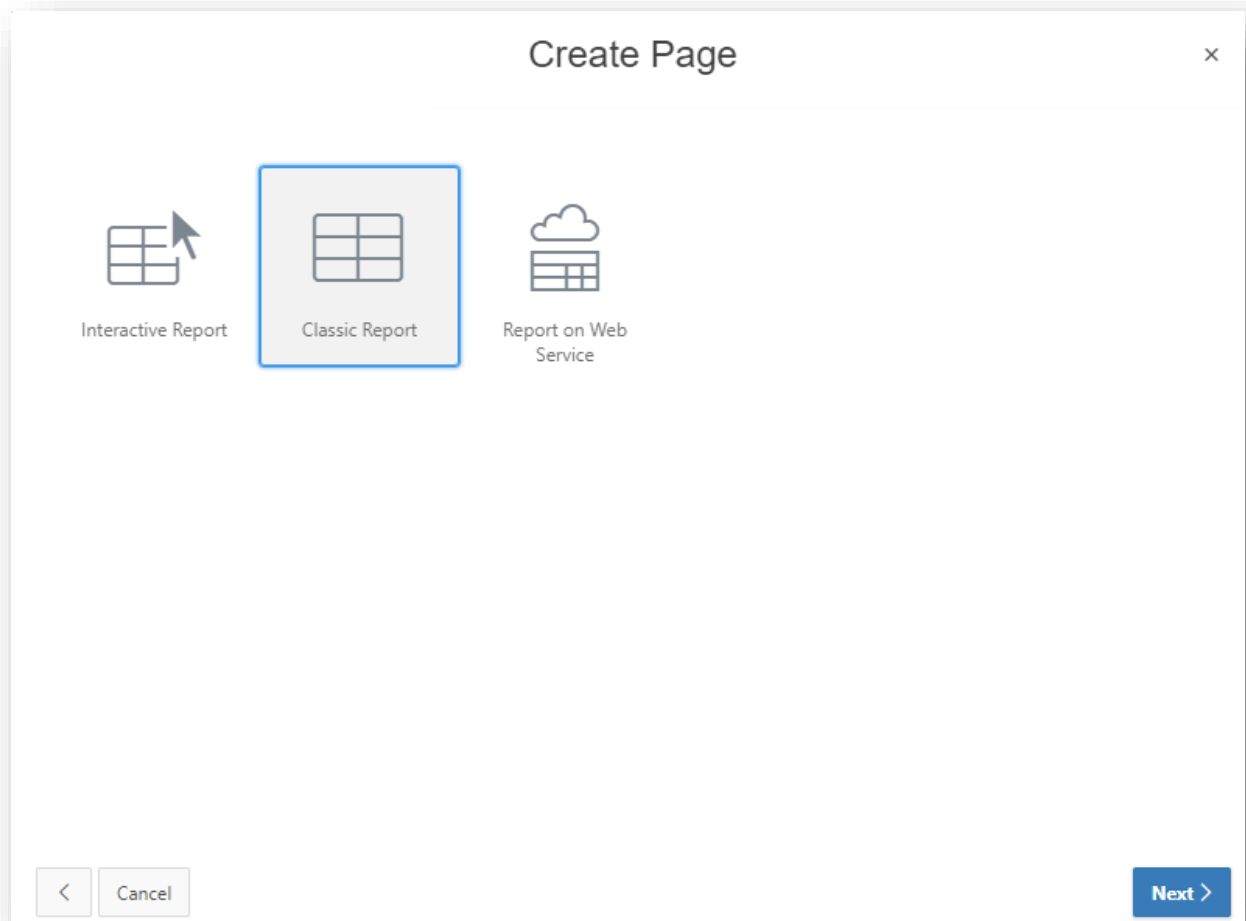

```

Depending upon which template you chose your Home page might look something like this.

To create Reports and Forms, from your application's main view select

Create Page >

For a simple and easy to create report, select Classic Report.

Type in your Page Name and Region Name.

The image shows a 'Navigation Menu' configuration dialog box. At the top, there is a progress bar with five dots; the second dot is blue, indicating the current step, while the first is green and the others are grey. Below the progress bar, the title 'Navigation Menu' is centered. The main content area has a light grey background and contains three sections. The first section, 'Navigation Preference', has three radio button options: 'Do not associate this page with a navigation menu entry' (unselected), 'Create a new navigation menu entry' (selected), and 'Identify an existing navigation menu entry for this page' (unselected). The second section, 'New Navigation Menu Entry', is marked with a red asterisk and contains a text input field with 'Books Report' and a help icon. The third section, 'Parent Navigation Menu Entry', contains a dropdown menu with three options: '- No parent selected -', 'Home' (which is highlighted in blue), and '... (Customers Report)'. At the bottom of the dialog, there are three buttons: a back button with a left arrow, a 'Cancel' button, and a 'Next >' button.

Navigation Menu

Navigation Preference

- ☐ Do not associate this page with a navigation menu entry ?
- ☒ Create a new navigation menu entry
- ☐ Identify an existing navigation menu entry for this page

* New Navigation Menu Entry Books Report ?

Parent Navigation Menu Entry

- No parent selected -
- Home
- ... (Customers Report)

< Cancel Next >

If you are doing the minimum requirements and using the Universal Template, you will want to select the Create a new navigation menu entry and select Home as the Parent Navigation Menu Entry.

The screenshot shows the 'Create Classic Report' dialog box with the 'Report Source' step selected. The 'Source Type' is set to 'Table'. The 'Table / View Owner' is 'US_B164_PLSQL_S09'. The 'Table / View Name' dropdown menu is open, showing a list of tables and views. The 'Select Columns' section is empty. The 'Next >' button is visible at the bottom right.

< Cancel Next >

The * Select Columns can be a bit deceiving as it might look like you need to put the required columns in the left box. Nope. The right-hand box will populate with all of the columns in the table. You move those columns you DO NOT want to display in your report to the left. You then use the arrow keys to order your columns. So, again, what you see in this graphic is those columns that WILL be included in the report.

There are two more steps in this wizard which you can just use the default settings.

Creating a report based on a query is done by simply selecting the SQL Query option in the Report Source step of your report generation.

Create Classic Report

Report Source

Source Type: ☐ Table ☒ SQL Query

* SQL Query

```
1 SELECT order# AS "Order Number", SUM(etail * quantity) AS Total
2 FROM orders NATURAL JOIN orderitems NATURAL JOIN books
3 HAVING SUM(etail * quantity) > ANY
4     (SELECT AVG(SUM(quantity * etail))
5      FROM orders NATURAL JOIN orderitems
6      NATURAL JOIN books
7      GROUP BY shipstate)
8 GROUP BY order#
```

Column Headings: ☒ Derived from query columns ☐ Generic columns

Maximum Number of Columns: 60

Next

Select the SQLQuery option and type in your query. You should use aliases in your column names in this step as that will save you time formatting your columns later.

Forms are pretty much the same steps as reports. I think by now you should have enough idea as to how to create an average project. I have put a couple of APEX User Manual PDF documents in the Outbox. I suggest you refer to them or the many YouTube how-to videos if you wish to score higher than average points.
